## NICKEL BASE ALLOYS

---

Since the advent of the aircraft gas turbine, there has been a steadily increasing need for materials exhibiting higher strength at progressively higher temperatures. It is this industry, therefore, which provided the impetus to the high temperature alloy development which has resulted in a large number of useful alloys to meet a variety of needs.

This review will deal with nickel-base superalloys containing about 40 weight per cent or more of nickel, and will present condensed information on mechanical properties at room and elevated temperatures, as well as limited data on physical properties. Some of the important cobalt-base and iron-nickel alloys in this class are also included as a convenience of reference.

It should be pointed out that the properties shown on various tables and graphs represent "typical" properties as nearly as possible. The values selected have been obtained from manufacturer's bulletins and other publications, and to the extent possible, have been checked with the producers as presenting the most recent information. The product form selected was that considered to be the most frequently employed. Since the data are "typical," they are unsuitable for specification or design purposes and the alloy producers should be consulted directly for "guaranteed minimum properties."

Mention has been made of the impetus to alloy development provided by jet engine requirements. However, application of these high nickel superalloys is by no means confined to that application. The alloys treated herein are being used more and more in other areas where their outstanding high temperature strength characteristics make them useful. Such applications include not only the natural extension to the requirements of industrial, automotive and auxiliary gas turbines but to less related fields, including air frames and skins, rocket engines, missiles and various hot die applications.

The booklet has been divided into two sections representing cast and wrought alloys. The division is a natural one in view of the end use applications for each form and was necessitated by the large number of alloys added to the current revision.

The opportunity has been taken to include further alloys of European origin.

It is, of course, impossible to include every commercial and experimental alloy in a compilation of this type and an attempt was made to limit alloy selection to those alloys considered to be either of growing interest to industry or widely used at present.

Sincere appreciation is expressed to all companies and agencies who have reviewed the enclosed data and allowed publication of the information. A number of alloys shown in the compilation are covered by trademarks which are credited on the inside back cover page.

### GENERAL DESCRIPTION OF HIGH NICKEL SUPERALLOYS

The alloys listed in this review are in the main "nickel-base," and most are of the Al-Ti age hardenable type. In these alloys, chromium is present to provide oxidation and sulfidation resistance along with some contribution to strength. Columbium, molybdenum, tungsten and

tantalum are often present, separately or in combination, to provide solid solution strengthening of the matrix. The major strengthening effect at high temperatures, however, is the result of the precipitation of the ordered fcc "gamma prime" phase, generally referred to as Ni<sub>3</sub>(Al, Ti). In some of the alloys, cobalt is present to effect improvements in workability and enhance high temperature capability. In many of the alloys included in the compilation, boron and zirconium are purposeful addition elements imparting improvements in high temperature creep properties and/or increased malleability.

## **COMPOSITION OF ALLOYS**

Tables 1 and 11 list the alloys included in this review showing composition, density, melting range, form and condition of the alloy for which data are presented.

## **PHYSICAL PROPERTIES**

Data are presented in tabular form on dynamic modulus, specific heat, thermal conductivity and thermal expansivity up to 2000 F (1093 C) and the general trend in change of properties as a function of temperature and class of alloys is presented graphically in Figures 1 through 24, respectively. It is interesting to note that with few exceptions the nickel-base alloys have very similar expansivity, despite considerable variations in composition, and that many of the cobalt-base superalloys have matching expansivity.

## **MECHANICAL PROPERTIES**

As noted previously, the properties of these alloys have been separated in graphs and tables into Cast and Wrought Alloy sections.

In the Wrought Alloy section, product forms include bar and sheet with bar being considered the normal product form to enable a comparison of heavier cross-section wrought alloys.

Many of the alloys traditionally regarded as wrought products have also been produced as castings. In some cases mechanical property data are available and both forms have been included in their respective sections.

## **METRICATION**

All physical and mechanical property data have been presented in British and metric units using standard international nomenclature. In addition, tabulated and graphical data are given in both Fahrenheit and Celsius temperatures.

The stress units selected were the familiar psi (rather than lbf/in.<sup>2</sup>) and meganewtons per square meter, or MN/m<sup>2</sup>. In converting the psi data to MN/m<sup>2</sup> for the tables, a four digit conversion was rounded to the nearest number five.

Conversion tables are provided in the Appendix.

## APPENDIX

### CONVERSION FACTORS

Because of the variety of metric and non-metric units employed for stress values, and the possibility of further changes, conversion factors are given below only for the more important of these, to and from SI metric units.

Note that meganewton per square meter ( $\text{MN}/\text{m}^2$ ), newton per square millimeter ( $\text{N}/\text{mm}^2$ ) and megapascal (MPa) are arithmetically identical.

#### Stress.

$$1 \text{ hbar} = 10 \text{ MN}/\text{m}^2 = 10 \text{ N}/\text{mm}^2 = 10 \text{ MPa}$$

$$1 \text{ kfg}/\text{mm}^2 = 9.807 \text{ MN}/\text{m}^2 = 9.807 \text{ MPa} = 9.807 \text{ N}/\text{mm}^2$$

$$10^3 \text{ psi} = 10^3 \text{ lbf/in.}^2 = 6.895 \text{ MN}/\text{m}^2 = 6.895 \text{ N}/\text{mm}^2 = 6.895 \text{ MPa}$$

$$1 \text{ tonf/in.}^2 = 15.44 \text{ MN}/\text{m}^2 = 15.44 \text{ N}/\text{mm}^2 = 15.44 \text{ MPa}$$

(long ton = 2240 lb)

$$1 \text{ MN}/\text{m}^2 = 0.1 \text{ hbar}$$

$$0.145 \times 10^3 \text{ psi}$$

$$1 \text{ N}/\text{mm}^2 = 0.145 \times 10^3 \text{ lbf/in.}^2$$

$$1 \text{ MPa} = 0.0647 \text{ tonf/in.}^2$$

$$0.102 \text{ kgf}/\text{mm}^2$$

#### Elastic Modulus.

$$10^6 \text{ psi} = 10^6 \text{ lbf/in.}^2 = 6.895 \text{ GN}/\text{m}^2 = 6.895 \text{ kN}/\text{mm}^2 = 6.895 \text{ GPa}$$

$$10^3 \text{ kgf}/\text{mm}^2 = 9.807 \text{ GN}/\text{m}^2 = 9.807 \text{ kN}/\text{mm}^2 = 9.807 \text{ GPa}$$

$$1 \text{ GN}/\text{m}^2 = 0.145 \times 10^6 \text{ psi}$$

$$1 \text{ kN}/\text{mm}^2 = 0.145 \times 10^6 \text{ lbf/in.}^2$$

$$1 \text{ GPa} = 0.102 \times 10^3 \text{ kgf}/\text{mm}^2$$

#### Specific Heat.

$$1 \text{ Btu/lb/}^\circ\text{F} = 4201 \text{ J/kg-K}$$

#### Thermal Conductivity.

$$1 \text{ Btu/ft}^2/\text{in./hr/}^\circ\text{F} = 0.1443 \text{ W/m-K}$$

#### Thermal Expansion.

$$1 \text{ microinch/in./}^\circ\text{F} = 1.8 \text{ micron/m/}^\circ\text{C}$$

## **NICKEL BASE ALLOYS – Data Supplement**

---

The Nickel Development Institute publication number 393, "high temperature — high strength NICKEL BASE ALLOYS", containing data on these cast and wrought nickel base alloys, dates back to 1984. Since that time there have been a significant number of new alloys that have come into use for high temperature applications.

This supplement has been published in order to provide an updated data compilation on the newer alloys since 1984. Also some of the older alloys, that have been available but had not been included in the original 1984 publication, have been added to this supplement.

In order to have a complete NiDI data publication package on the Nickel Base Alloys (including some cobalt base alloys as well) the user needs both the original 1984 date publication, NiDI #393, and this 1995 supplement.

Please note that the data contained herein has been gathered from a variety of sources including published literature, alloy producers and users, as well as by private communications. Their cooperation in accomplishing this compilation has been most helpful and is greatly appreciated.

In some instances tradenames, or trademarks, have been used to identify an alloy, even though the alloy may be made by a variety of producers other than the trademark source. This is because such names are widely recognized and in many instances no UNS numbers have been assigned to the alloys. Credit for these tradenames, or trademarks, is shown on the last page of this supplement. A listing of alloys with equivalent UNS numbers where such are in existence is also provided for reference.

For some alloys data are not complete, or not available. Some of the data is considered proprietary and is not open for general information, or has not yet been developed.

Lastly, the data shown here are believed to be typical values for the alloys covered. Mechanical property values are for the typical "as supplied" heat treated condition, solution annealed and/or aged when applicable to that alloy. Values shown do not represent guaranteed minimum or maximum values but are intended as guides for comparison of the alloys one to another. Neither the sources providing the data nor the Nickel Development Institute are responsible for errors or variations in data shown here from values encountered in actual applications.

16	Rene N5	.312	8.6	18.5	16.0	15.3	14.4	12.6

\* Note: Modulus values are approximate and are based upon typical characteristics of alloy family.

Alloys used for Single Crystal castings:

Rene N4 & N5  
PWA 1480 & 1484  
CMSX-2, 3, 4, 6

Alloys used for Directional Solidification:

CM 186LC, CM 247LC

**TABLE 3  
MEAN COEFFICIENT of THERMAL EXPANSION**

Data for the individual alloys are not available. In general, for the cast alloys listed in this supplement, the thermal expansion values are as follows:

**Mean Coefficient of Thermal Expansion 70°F to Temp. x 10<sup>-6</sup>**

1000F (540C)	1200F (650C)	1400F (760C)	1600F (870C)	1800F (980C)
7.9	8.1	8.4	8.8	9.2

Note: These are "typical" values as generally in the proper range for nickel base cast alloys. The values are not exact and may be used as a guide only.
